The Panel switch was named for its tall panels which consisted of layered strips of terminals. Between each strip was placed an insulating layer, which kept each metal strip electrically isolated from the ones above and below. These terminals were arranged in banks, five of which occupied an average selector frame. Each bank contained 100 sets of terminals, for a total of 500 sets of terminals per frame. At the bottom, the frame had two electric motors to drive sixty selectors up and... 5f64607736 Tay-Sachs disease is caused by a genetic mutation in the HEXA gene on chromosome 15, which codes a subunit of the hexosaminidase enzyme... 5f64607736

DNA repair This is an expensive process because each MGMT molecule can be used only DNA repair is a collection of processes by which a cell identifies and corrects damage to the DNA molecules that encode its genome. guanine methyl transferase (MGMT), the bacterial equivalent of which is called ogt. DNA modifications can also be programmed. DNA is constantly modified in cells, by internal metabolic by-products, and by external ionizing radiation, ultraviolet light, and medicines, resulting in spontaneous DNA damage involving tens of thousands of individual molecular lesions per cell per day. A weakened capacity for DNA repair is a risk factor for the development of cancer 5f64607736
