Jammed finger This kind of impact can stretch or strain the ligaments in the joint beyond their normal limits. The severity of damage to the finger increases with the amount of force on the fingertip. It occurs most often when the finger is fully extended. This type of directional force is called axial loading. In severe cases, injury to bone may occur. Toes may become jammed as well, with similar results. Filliole, Antoine; Lambeaux, Constance; Van, Viet-Tam; Adamski, Elorie; Bachour, Rafy; Goumarre, Céline; Chiavassa, Hélène; Faruch Bilfeld, Marie; Sans Jammed finger is a common term used to describe various types of finger joint injuries. It happens from a forceful impact originating at the tip of the finger directed towards the base. When experiencing a jammed finger, the extent of injury is not always obvious and one should be evaluated by a medical professional

Near-infrared window in biological tissue of Texas M. C. Because scattering has weak dependence on wavelength, the NIR window is primarily limited by the light absorption of blood at short wavelengths and water at long wavelengths. Cardoso, 2023, Optical attenuation coefficient The near-infrared (NIR) window (also known as optical window or therapeutic window) defines the range of wavelengths from 650 to 1350 nanometre (nm) where light has its maximum depth of penetration in tissue. The technique using this window is called NIRS. Eschenbach. Univ. T. Anderson Cancer Center, 1987. Dominguez, and G. de Souza Bachour, C. Medical imaging techniques such as fluorescence image-guided surgery often make use of the NIR window. Since scattering increases the distance travelled by photons within tissue, the probability of photon absorption also increases. Within the NIR window, scattering is the most dominant light-tissue interaction, and therefore the propagating light becomes diffused rapidly. R. D. P 608bfb4bca
