Life extension Life extension is the concept of extending the human lifespan, either modestly through improvements in medicine or dramatically by increasing the maximum Life extension is the concept of extending the human lifespan, either modestly through improvements in medicine or dramatically by increasing the maximum lifespan beyond its generally-settled biological limit of around 125 years. Several researchers in the area, along with "life extensionists", "immortalists", or "longevists" (those who wish to achieve longer lives themselves), postulate that future breakthroughs in tissue rejuvenation, stem cells, regenerative medicine, molecular repair, gene therapy, pharmaceuticals, and organ replacement (such as with artificial organs or xenotransplantations) will eventually enable humans to have indefinite lifespans through complete rejuvenation to a healthy youthful condition (agerasia). The ethical ramifications, if life extension becomes a possibility 86a7df8728

Gone with the Wind (novel) " This historical novel features a coming-of-age story, with the title taken from the poem Non Sum Qualis eram Bonae Sub Regno Cynarae by Ernest

Dowson. The novel has been absorbed into American popular culture. Scholars at American universities refer to, interpret, and study it in their writings. The story is set in Clayton County and Atlanta, both in Georgia, during the American Civil War and Reconstruction Era. It depicts the struggles of young Scarlett O'Hara, the spoiled daughter of a well-to-do plantation owner, who must use every means at her disposal to claw her way out of poverty following Sherman's destructive "March to the Sea. Enzyme promiscuity Although enzymes are remarkably specific catalysts, they can often perform side reactions in addition to their main, native catalytic activity. One study showed Enzyme promiscuity is the ability of an enzyme to catalyze an unexpected side reaction in addition to its main reaction. ADP evolved from melamine deaminase (triA encoded), which has very small promiscuous activity toward atrazine, a. These wild activities are usually slow relative to the main activity and are under neutral selection. the novel activity is improved and the gene is duplication is not clear cut, unlike what the theoretical models of gene evolution suggest. An example of this is the atrazine chlorohydrolase (atzA encoded) from *Pseudomonas* sp. Despite ordinarily being physiologically irrelevant, under new selective pressures, these activities may confer a fitness benefit therefore prompting the evolution of the formerly promiscuous activity to become the new main activity 86a7df8728
