An important distinction is between metrics that are independent of the prevalence or skew (how often each class occurs in the population), and metrics that depend on the prevalence – both types are useful, but they have very different properties. b0c3c95004 Sensitivity (true positive rate) is the probability of a positive test result, conditioned on the individual truly being positive. b0c3c95004 Specificity (true negative rate) is the probability of a negative test result, conditioned on the individual truly being negative. b0c3c95004 There are many metrics that can be used; different fields have different preferences. For example, in medicine sensitivity and specificity are often used, while in computer science precision and recall are preferred. b0c3c95004

Sensitivity and specificity If individuals who have the condition are considered "positive" and those who do not are considered "negative", then sensitivity is a measure of how well a test can identify true positives and specificity is a measure of how well a test can identify true negatives:. positives + number of false negatives = number of true positives total number of sick individuals in population = probability of a positive test given In medicine and statistics, sensitivity and specificity mathematically describe the accuracy of a test that reports the presence or absence of a medical condition b0c3c95004
