Intel's processor technology takes advantage of DBS techniques. AMD processors uses a similar process, which the company calls "Power Now". E.164 defines a general format for international telephone numbers. Plan-conforming telephone numbers are limited to only digits and to a maximum of fifteen digits. The specification divides the digit string into a country code of one to three digits, and the subscriber telephone number of a maximum of twelve digits.

Internet service provider 29 December 2014. TDM to IP Solution (PDF). ISPs can be organized in various forms, such as commercial, community-owned, non-profit, or otherwise privately owned. Implementing Cisco IP Routing (ROUTE) Foundation Learning Guide: (CCNP ROUTE 300-101). Cisco Press. ISBN 978-0-13-396586-5 An Internet service provider (ISP) is an organization that provides a myriad of services related to accessing, using, managing, or participating in the Internet

Intel uses demand-based switching power management technology to control power voltage consumption at different states of a computer's operations. DBS routines select a minimum clock speed of the microprocessor appropriate to the workload which specific tasks being performed by the computer place on the processor. This results in less electricity being consumed, both by the processor and by fans counteracting excess heat output.
