

Functional Independence Measure Manual

Wheelchair Wheelchairs provide mobility, postural support, and freedom to those who cannot walk or have difficulty walking, enabling them to move around, participate in everyday activities, and live life on their own terms. It is used when walking is difficult or impossible to do due to illnesses, injury, disabilities, or age-related health conditions. wheelchairs, where propulsion is provided by batteries and electric motors, and manual wheelchairs, where the propulsive force is provided either by the wheelchair A wheelchair is a mobilized form of chair using two or more wheels, a footrest, and an armrest usually cushioned 00c67fa979

Software quality Points to measure the functional size of software and Automated Enhancement Points to measure the size of both functional and non-functional code in one In the context of software engineering, software quality refers to two related but distinct notions: 00c67fa979

Software's functional quality reflects how well it complies with or conforms to a given design, based on functional requirements or specifications. That attribute can also be described as the fitness for the purpose of a piece of software or how it compares to competitors in the marketplace as a worthwhile product. It is the degree to which the correct software was produced. 00c67fa979 Wheelchairs come in a wide variety of formats to meet the specific needs of their users. They may include specialized seating adaptations, and individualized controls, and may be specific to particular activities, as with sports wheelchairs and beach wheelchairs. The most widely recognized distinction is between motorized wheelchairs, where propulsion... 00c67fa979 Software structural quality refers to how it meets non-functional requirements that support the delivery of the functional requirements, such as robustness or maintainability. It has a lot more to do with the degree to which the software works as needed. 00c67fa979 Many aspects of structural quality can be evaluated only statically... 00c67fa979 The original version of the GMFCS was developed in 1997. As of 2007, the expanded and revised version, known as GMFCS - E&R, further includes an age band for youth 12 to 18 years. 00c67fa979

Gross Motor Function Classification System The Gross Motor Functional Measure is sometimes used instead of the GMFCS. Distinctions between levels are based on functional abilities; the need for walkers, crutches, wheelchairs, or canes / walking sticks; and to a much lesser extent, the actual quality of movement. Particular emphasis in creating and maintaining the GMFCS scale rests on evaluating sitting, walking, and wheeled mobility. Communication Function Classification System Manual Ability Classification The Gross Motor Function Classification System or GMFCS is a 5 level clinical classification system that describes the gross motor function of people with cerebral palsy on the basis of self-initiated movement abilities. GMFCS 00c67fa979

Panic button It is designed to contact assistance quicker, easier, and

simpler (in some cases, less conspicuously) than a conventional phone call. (such as a nuclear weapons system) used to quickly activate an extreme measure to mitigate an emergency situation. A red button integral to key fobs which A panic alarm is an electronic device that can easily be activated to request help during an emergency where danger to persons or property exists 00c67fa979

Limits of stability This stable swaying area is often referred to as the 'Cone of Stability', which varies depending on the specific task being performed. In simpler terms, LoS represents the maximum distance an individual can intentionally sway in any direction without losing balance or needing to take a step. The typical range of stable swaying is approximately 12. 5° in the front-back (antero-posterior) direction and 16° in the side-to-side (medio-lateral) direction. that using the amount of distance covered in the functional reach test alone may not be an adequate measure of dynamic balance. The study also highlights Limits of Stability (LoS) are a concept in balance and stability, defined as the points at which the center of gravity (CoG) approaches the limits of the base of support (BoS) and requires a corrective strategy to bring the center of mass (CoM) back within the BoS 00c67fa979

Many panic alarm buttons lock on when pressed, and require a key to reset them. Others may have a short delay during which time... 00c67fa979 The original concept was developed collaboratively by Robert Palisano, Professor... 00c67fa979 Many voting systems outside of the United States, including the British parliamentary system, do not utilize a party affiliation system as part of their voter registration process; rather, participation in party affairs is based on enrolling as a... 00c67fa979

Greek letters used in mathematics, science, and engineering optimization, known as the shadow price in economics the Lebesgue measure denotes the volume or measure of a Lebesgue measurable set longitude in geodesy linear Greek letters are used in mathematics, science, engineering, and other areas where mathematical notation is used as symbols for constants, special functions, and also conventionally for variables representing certain quantities. Small ι, ο and υ are also rarely used, since they closely resemble the Latin letters i, o and u. In these contexts, the capital letters and the small letters represent distinct and unrelated entities. Those Greek letters which have the same form as Latin letters are rarely used: capital Α, Β, Ε, Ζ, Η, Ι, Κ, Μ, Ν, Ο, Ρ, Τ, Υ, and Χ. Sometimes, font variants of Greek letters are used as distinct symbols in mathematics, in particular for ε/ε and π/ω. The archaic letter digamma (Ϝ/ϝ/ϙ) is sometimes used 00c67fa979

F1 (classification) endurance. People in this class have no sitting balance, and are tetraplegics. This is F1, also T1 and SP1, is a wheelchair sport classification that corresponds to the neurological level C6. The process for classification into this class has a medical and functional classification process. This process is often sport specific. They may be able to perform limited actions with one hand. They lack sitting balance, and have limited head control and respiratory endurance. This process is often sport specific. The process for classification into this class has a medical and functional

classification process. Historically, it was known as 1A Complete

A panic alarm is frequently but not always controlled by a concealed panic alarm button. These buttons can be connected to a monitoring center or locally via a silent alarm or an audible bell/siren. The alarm can be used to request emergency assistance from local security, police or emergency services. Some systems can also activate closed-circuit television to record or assess the event. 00c67fa979

Rehabilitation in spinal cord injury By using a variety of treatments, greater improvements are achieved, and, therefore, treatment should not be limited to one method. rehabilitation or discharged, occupational therapists attempt to maximize functional independence at this stage. Furthermore, increasing activity will increase his/her chances of recovery. Depending on the level of the spinal cord injury When treating a person with a spinal cord injury, repairing the damage created by injury is the ultimate goal
00c67fa979

Glasgow Outcome Scale It considers several factors such as a patient's ability to communicate, to function independently in activities of daily living (ADLs), and ability to return to work or school. The Glasgow Outcome Scale aims to characterize the overall functional outcome and quality of life in patients after sustaining brain injury The Glasgow Outcome Scale (GOS) is an interview-based method used since the 1970's to assess a patient's level of recovery from brain injury. differences. The basic scale has five broad categories: death, vegetative state, severe disability, moderate disability, or good recovery; an extended version (GOSE) of the original scale includes three sub-categories for a total of eight possible outcomes. Both versions of the scale have been widely adopted in clinical practice, as well as in research studies on brain injury 00c67fa979

Independent voter a poor measure of partisanship. An independent is variously defined as a voter who votes for candidates on issues rather than on the basis of a political ideology or partisanship; a voter who does not have long-standing loyalty to, or identification with, a political party; a voter who does not usually vote for the same political party from election to election; or a voter who self-describes as an independent. The value An independent voter, often also called an unaffiliated voter or non-affiliated voter in the United States, is a voter who does not align themselves with a political party. More recently, scholars focused on self-identification as a good measure of a person's political independence 00c67fa979
