Yourself cccde5861a Body cells divide by MITOSIS. Each cell
produces two genetically identical daughter cells. The cells
produced are diploid. cccde5861a Asexual reproduction
uses mitosis to make new individuals. Only one parent is
needed. The offspring have the same alleles as the parent.

The chromosomes then line up along the

equator. Each pair of chromosomes then splits into the two identical copies. Each copy moves to opposite poles of the cell. New nuclei form and the cell divides to create two identical copies of the original cell. cccde5861a Cell cycle cccde5861a Intro cccde5861a Divisions cccde5861a chromatin cccde5861a prophase cccde5861a Subtitles and closed captions cccde5861a DNA Replication DNA is a double stranded molecule. The molecule unzips to expose the bases on each strand. Spare DNA bases in the nucleus line up with the complementary base pairs. This creates two identical copies of the DNA. cccde5861a Interphase cccde5861a Intro cccde5861a PROFESSOR DAVE EXPLAINS cccde5861a
