For an ordinary angle, this is often visualized or defined using the arc of a circle centered at the vertex and lying between the sides. Angular measure or measure of angle are sometimes used to distinguish between the measurement and figure itself. Angles are measured in various units, the most common being In Euclidean geometry, an angle is the opening between two lines in the same plane that meet at a point. The term angle is used to denote both geometric figures and their size or magnitude

This regular periodic advancement moves the clock's hands forward at a steady rate. At the same time. The impulse action transfers energy to the clock's timekeeping element (usually a pendulum or balance wheel) to replace the energy lost to friction during its cycle and keep the timekeeper oscillating. Each swing of the pendulum or balance wheel releases a tooth of the escapement's escape wheel, allowing the clock's gear train to advance or "escape" by a fixed amount. The style is the time-telling edge of the gnomon, though a single point or nodus may be used. The gnomon casts a broad shadow; the shadow of the style shows the time. The style

must be parallel to the axis of the Earth's rotation for the sundial to be accurate throughout the year. As the Sun appears to move through the sky, the shadow aligns with different hour-lines, which are marked on the dial to indicate the time of day. In the narrowest sense of the word, it consists of a flat plate (the dial) and a gnomon, which casts a shadow onto the dial. After the invention of good clocks, sundials were still considered to be correct, and clocks usually incorrect

The vehicle must be considered to have a front, a back, a left side and a right side. These quarters may have specialized names, such as bow and stern for a vessel, or nose and tail for an aircraft. The observer then measures or observes the angle made by the intersection of the line of sight to the longitudinal axis, the dimension of length, of the vessel, using the clock analogy
