POP-11 is an evolution of the language POP-2, developed in Edinburgh University, and features an open stack model (like Forth, among others). It is mainly procedural, but supports declarative language constructs, including a pattern matcher, and is mostly used for research and teaching in artificial intelligence, although it has features sufficient for many other classes of problems. It is often used to introduce symbolic programming techniques to... To build and curate an archive, one must acquire and evaluate the materials, and be able to access them later. To this end, archival science seeks to improve methods for appraising, storing, preserving, and processing (arranging and describing) collections of materials.
