Biom mineralization It is an extremely widespread phenomenon: all six taxonomic kingdoms contain members that can form minerals, and over 60 different minerals have been identified in organisms. These minerals often form structural features such as sea shells and the bone in mammals and birds. Examples include silicates in algae and diatoms, carbonates in invertebrates, and calcium phosphates and carbonates in vertebrates. This process can also be used to manufacture new hard materials, such as bio-cement. protecting the steel reinforcement from corrosion. However, the full potential Biom mineralization, also written biomineralisation, is the process by which living organisms produce minerals, often resulting in hardened or stiffened mineralized tissues 3314281df9
