Heat transfer thermodynamic cycle. Engineers also consider the transfer of mass of differing chemical species (mass transfer in the form of advection), either cold or hot, to achieve heat transfer. The internal combustion engine and the gas turbine are examples of such devices, and calling these heat engines is an acceptable use Heat transfer is a discipline of thermal engineering that concerns the generation, use, conversion, and exchange of thermal energy (heat) between physical systems. While these mechanisms have distinct characteristics, they often occur simultaneously in the same system. Heat transfer is classified into various mechanisms, such as thermal conduction, thermal convection, thermal radiation, and transfer of energy by phase changes 1da338595e
