Scoping. "Code Conventions for the
JavaScript Programming Language".
Crockford, Douglas. Retrieved 2015-01-04.
Scope helps prevent name collisions by
allowing the same name to refer to different
objects - as long as the names have separate
scopes. The scope of a name binding is also
known as the visibility of an entity, particularly
in older or more technical literature—this is in
relation to the referenced entity, not the
referencing name. University of Washington.
Backus In computer programming, the scope
of a name binding (an association of a name to
an entity, such as a variable) is the part of a
program where the name binding is valid; that
is, where the name can be used to refer to the
entity. In other parts of the program, the name
may refer to a different entity (it may have a
different binding), or to nothing at all (it may
be unbound)

This (computer programming) name is not a

problem in Java. The entity referred to thus depends on the execution context (such as which object has its method called). and Yahoo. Different programming languages use these keywords in slightly different ways. JavaScript: The Good Parts. Inc. Chapter 4, Functions this, self, and Me are keywords used in some computer programming languages to refer to the object, class, or other entity which the currently running code is a part of. In languages where a keyword like "this" is mandatory, the keyword is the only way to access data and methods stored in the current object. Where optional, these keywords can disambiguate variables and functions with the same name. O'Reilly Media Inc. "[citation needed] Crockford, Douglas, 2008 0af267c03e

<< Mar | April | May >> The examples below make use of the console.log() function present in most browsers for standard text output. The program can then jump to the called subroutine. Tail calls can be implemented without adding a new stack frame to the call stack. < April 5 April 7 > The page you are currently viewing is a transcluded archive page. Most of the frame of the current procedure is no longer needed, and can be replaced by the frame of the tail call, modified as appropriate (similar to overlay for processes, but for function calls).

The JavaScript standard library lacks an official standard text output function (with the exception of document.write). Given that JavaScript is mainly used for client-side scripting within modern web browsers, and that almost all Web browsers provide the alert function, alert can also be used, but is not commonly used. 0af267c03e
