Specific heat capacity New York, NY US: John Wiley & Sons In thermodynamics, the specific heat capacity (symbol c) of a substance is the amount of heat that must be added to one unit of mass of the substance in order to cause an increase of one unit in temperature. More formally it is the heat

capacity of a sample of the substance divided by the mass of the sample. For example, the heat required to raise the temperature of 1 kg of water by 1 K is 4184 joules, so the specific heat capacity of water is $4184 \text{ J}\cdot\text{kg}^{-1}\cdot\text{K}^{-1}$. It is also referred to as massic heat capacity or as the specific heat. The SI unit of specific heat capacity is joule per kelvin per kilogram, $\text{J}\cdot\text{kg}^{-1}\cdot\text{K}^{-1}$. Heat transfer occurs at a lower rate in materials of low thermal conductivity than in materials of high thermal conductivity. For instance, metals typically have high thermal conductivity and are very efficient at conducting heat, while the opposite is true for insulating materials such as mineral wool or Styrofoam. Metals have this high thermal conductivity due to free electrons facilitating heat transfer. Correspondingly, materials of high thermal... c871c5f36b Create a command file, for example ListCheckWiki545.txt with the following contents: c871c5f36b ListCheckWiki enwiki-\$-pages-articles.xml.bz2 wiki:Wikipedia:CHECKWIKI/WPC_{0}_dump 545 c871c5f36b Initially available only in English, Wikipedia exists in over 340 languages and is the world's ninth most visited website.
