Machine learning and toward methods and models borrowed from statistics, fuzzy logic, and probability theory. Within a subdiscipline in machine learning, advances in the field of deep learning have allowed neural networks, a class of statistical algorithms, to surpass many previous machine learning approaches in performance. There is a close connection between machine learning and Machine learning (ML) is a field of study in artificial intelligence concerned with the development and study of statistical algorithms that can learn from data and generalise to unseen data, and thus perform tasks without explicit instructions 5efd7bfa2a

Diffusion model The probability path and the velocity field also satisfy the continuity equation, in the sense of probability distribution: $\partial_t p + \nabla \cdot (p \mathbf{v}) = 0$. In machine learning, diffusion models, also known as diffusion-based generative models or score-based generative models, are a class of latent variable generative models. $p_0 = \pi_1$. A diffusion model models data as generated by a diffusion process, whereby a new datum performs a random walk with drift through the space of all possible data. A diffusion model consists of two major components: the forward diffusion process, and the reverse sampling process. The goal of diffusion models is to learn a diffusion process for a given dataset, such that the process can generate new elements that are distributed similarly as the original dataset. A trained diffusion model can be sampled in many ways, with different efficiency and quality.
