Cache performance measurement and metric Hennessy, David A. (2011). Patterson, John L. San Francisco, Calif A CPU cache is a piece of hardware that reduces access time to data in memory by keeping some part of the frequently used data of the main memory in a 'cache' of smaller and faster memory. A hard disk failure may occur in the course of normal operation, or due to an external factor such as exposure to fire or water or high magnetic fields, or suffering a sharp impact or environmental contamination, which can lead to a head crash.

 system depends on the performance of all individual units—which include execution units like integer, branch and
 floating point, I/O units, bus, caches and memory systems. The gap between processor speed and main memory
 speed has grown exponentially. Until 2001–05, CPU speed, as measured by clock frequency, grew annually by
 55%, whereas memory speed only grew by 7%. This problem is known as the memory wall. The motivation for a
 cache and its hierarchy is to bridge this speed gap and overcome the memory wall. 3063cc2920 Create a
