The company's Acorn Electron, released in 1983, and the later Acorn Archimedes, were highly popular in Britain, while Acorn's BBC Micro computer dominated the educational computer market during the 1980s. The company also designed the ARM architecture and the RISC OS operating system for it. The architecture part of the business was spun-off as Advanced RISC Machines under a joint venture with Apple and VLSI in 1990,...

The first solid-state electronic calculator was created in the early 1960s. Pocket-sized devices became available in the 1970s, especially after the Intel 4004, the first microprocessor, was developed by Intel for the Japanese calculator company Busicom. Modern electronic calculators vary from cheap, give-away, credit-card-sized models to sturdy desktop models with built-in printers. They became popular in the mid-1970s as the incorporation of integrated circuits reduced their size and cost. By the end of that decade, prices had dropped to the point where a basic calculator was affordable to most and they became

Acorn Computers was a British computer company established in Cambridge, England in 1978 by Hermann Hauser, Chris Curry and Andy Hopper. named Galileo, and, in conjunction with Digital Semiconductor and ARM, a new StrongARM chipset consisting of the SA-1500 and SA-1501. The company produced a number of computers during the 1980s with associated software that were highly popular in the domestic market, and they have been historically influential in the development of computer technology like processors. RCA 1802 The first production model was the two-chip CDP1801R and CDP1801U, which were later combined into the single-chip CDP1802. aerospace. It is historically notable as the first CMOS microprocessor. The 1802 represented the majority of COSMAC production, and today the entire line is known simply as the RCA 1802. Multiple 1802s were used as auxiliary IO processors in the Galileo probe to Jupiter in 1989, and it remains in use in similar roles to this The

Intel Edison communication modules and more. The system was initially announced to be the same size and shape as an SD card and containing a dual-core Intel Quark x86 CPU at 400 MHz communicating via Bluetooth and Wi-Fi. A later announcement changed the CPU to a 500 MHz Silvermont dual-core Intel Atom CPU, and in September 2014 a second version of Edison was shown at IDF, which was bigger and thicker than a standard SD card. Microprocessors contain both combinational logic and sequential digital logic, and operate on numbers and symbols represented in the. The microprocessor is a multipurpose, clock-driven, register-based, digital integrated circuit that accepts binary data as input, processes it according to instructions stored in its memory, and provides results (also in binary form) as output. Archived from the original on 6 October - A microprocessor is a computer processor for which the data processing logic and control is included on a single integrated circuit (IC), or a small number of ICs. February 2010. com. The IC is capable of interpreting and executing program instructions and performing arithmetic operations. The microprocessor contains the arithmetic, logic, and control circuitry required to perform the functions of a computer's central processing unit (CPU) 7c2847e5b5

GNSS receivers have been traditionally implemented in hardware: a hardware GNSS receiver is conceived as a dedicated chip that has been designed and built (from the very beginning) with the only purpose of being a GNSS receiver.

7c2847e5b5 Printed for 244 years, the Britannica was the longest-running in-print encyclopaedia in the English language. Dive computer Technical diving software for Galilio: User manual (PDF) A dive computer, personal decompression computer or decompression meter is a device used by an underwater diver to measure the elapsed time and depth during a dive and use this data to calculate and display an ascent profile which, according to the programmed decompression algorithm, will give a low risk of decompression sickness. Dive computers are a development from decompression tables, the diver's watch and depth gauge, with greater accuracy and the ability to monitor dive profile data in real time. A secondary function is to record the dive profile, warn the diver when certain events occur, and provide useful information about the environment. pp. Computer User's Guide. 40-42. 2003.
