List of datasets for machine-learning research Major advances in this field can result from advances in learning algorithms (such as deep learning), computer hardware, and, less-intuitively, the availability of high-quality training datasets. org. defcon. Datasets are an integral part of the field of machine learning. High-quality labeled training datasets for supervised and semi-supervised machine learning algorithms are usually difficult and expensive to produce because of the large amount of time needed to label the data. Shah, Shreeraj. owasp. org. "Blind SQL injection discovery & exploitation technique" These datasets are used in machine learning (ML) research and have been cited in peer-reviewed academic journals. Although they do not need to be labeled, high-quality datasets for unsupervised learning can also be difficult and costly to produce. "Advanced SQL Injection" (PDF). Hardening" (PDF). McCray, Joe

Microsoft SQL Server As a database server, it is a software product with the primary function of storing and retrieving data as requested by other software applications—which may run either on the same computer or on another computer across a network (including the Internet). data from a SQL Server database is querying for it. Microsoft markets at least a dozen different editions of Microsoft SQL Server, aimed at different audiences and for workloads ranging from small single-machine applications to large Internet-facing applications with many

concurrent users. The query is expressed using a variant of SQL called T-SQL, a dialect Microsoft SQL Server shares Microsoft SQL Server is a proprietary relational database management system developed by Microsoft using Structured Query Language (SQL, often pronounced "sequel")

Entity-attribute-value model approaches you take, querying EAV will not be as fast as querying standard column-modeled relational data for certain types of query, in much the same way An entity-attribute-value model (EAV) is a data

model optimized for the space-efficient storage of sparse—or ad-hoc—property or data values, intended for situations where runtime usage patterns are arbitrary, subject to user variation, or otherwise unforeseeable using a fixed design. The use-case targets applications which offer a large or rich system of defined property types, which are in turn appropriate to a wide set of entities, but where typically only a small, specific selection of these are instantiated (or persisted) for a given entity. Therefore, this type of data model relates to the mathematical notion of a sparse matrix
