Stratified squamous epithelium [referring A stratified squamous epithelium consists of squamous (flattened) epithelial cells arranged in layers upon a basal membrane. There are no intercellular spaces. Although this epithelium is referred to as squamous, many cells within the layers may not be flattened; this is due to the convention of naming epithelia according to the cell type at the surface. p. In the deeper layers, the cells may be columnar or cuboidal. It forms the outermost layer of the skin and the inner. This type of epithelium is well suited to areas in the body subject to constant abrasion, as the thickest layers can be sequentially sloughed off and replaced before the basement membrane is exposed. Only one layer is in contact with the basement membrane; the other layers adhere to one another to maintain structural integrity. Introduction to the Human Body.). John Wiley & Sons, Inc. 84. Stomach The stomach has a dilated structure and functions as a vital organ in the digestive system. The Stomach at The Anatomy Lesson by Wesley Norman (Georgetown The stomach is a muscular, hollow organ in the upper gastrointestinal tract of humans and many other animals, including several invertebrates. 6/6ch2/s6ch2_30". Essentials of Human Physiology. The stomach is involved in the gastric phase of digestion, following the cephalic phase in which the sight and smell of food and the act of chewing are stimuli. It also plays a role in regulating gut microbiota, influencing digestion and overall health. In the stomach a chemical breakdown of food takes place by means of secreted digestive enzymes and gastric acid. The Ancient Greek name for the stomach is gaster which is used as gastric in medical terms related to the stomach. Archived from the original on 2016-03-24 9e48202a1c

Interlobar veins Waschke, Jens; Böckers The interlobar veins are veins of the renal circulation which drain the renal lobes. The interlobar veins unite to form a renal vein. (2017). They collect blood from the arcuate veins. 690. p. Pearson. ISBN 9780134320762. pyramids. Martini, Frederic; Tallitsch, Robert B. ; Nath, Judi L. Gray's Anatomy It has had multiple revised editions, and the current edition, the 42nd (October 2020), remains a standard reference, often considered "the doctors' bible". Gray's Anatomy is a reference book of human anatomy written by Henry Gray, illustrated by Henry Vandyke Carter and first published in London in 1858. Anatomy Anatomy is inherently tied to developmental biology, embryology, comparative anatomy, evolutionary biology, and phylogeny, as these are the processes by which anatomy is generated, both over immediate and long-term timescales. anatomy is generated, both over immediate and long-term timescales. Human anatomy is one of the essential basic. Anatomy is a branch of natural science that deals with the structural organization of living things. Anatomy and physiology, which study the structure and function of organisms and their Anatomy (from Ancient Greek ἀνατομή (anatomé) 'dissection') is the branch of morphology concerned with the study of the internal and external structure of organisms and their parts. It is an old science, having its beginnings in prehistoric times. Anatomy and physiology, which study the structure and function of organisms and their parts respectively, make a natural pair of related disciplines, and are often studied together 9e48202a1c

Arcuate vein It is located at the border of the renal cortex and renal medulla. Arcuate veins receive blood from cortical radiate veins, and in turn deliver blood into the arcuate veins. Arcuate veins pass around the renal pyramids at the border between the renal cortex and renal medulla in an arch shape. Human Anatomy (9th ed.). ISBN 9780134320762. ; Nath, Judi L. The book is a medical treatise about melancholy (depression). Over 500,000 words long, it discusses a wide range of topics besides depression — including history, astronomy, geography, and various aspects of literature and science — and frequently uses humour to make points or explain topics. Burton wrote it under the pseudonym Democritus Junior... 9e48202a1c The stomach is located between the esophagus and the small intestine. The pyloric... 9e48202a1c Each renal artery branches into segmental arteries, dividing further into interlobar arteries, which penetrate the renal capsule and extend through the renal columns between the renal pyramids. The interlobar arteries then supply blood to the arcuate arteries that run through the boundary of the cortex and the medulla. Each arcuate artery supplies several interlobular arteries that feed into the afferent arterioles that supply the glomeruli. 9e48202a1c Earlier editions were called Anatomy: Descriptive and Surgical, Anatomy of the Human Body and Gray's Anatomy: Descriptive and Applied, but the book's name is commonly shortened to, and later editions are titled, Gray's Anatomy. The book is widely regarded as an extremely influential work on the subject. 9e48202a1c

Development of the human body The resulting zygote develops through cell proliferation and differentiation, and the resulting embryo then implants in the uterus, where the embryo continues development through a fetal stage until birth. This continues throughout life: through childhood and adolescence into adulthood. The process begins with fertilization, where an egg released from the ovary of a female is penetrated by a sperm cell from a male. Further growth and development continues after birth, and includes both physical and psychological development that is influenced by genetic, hormonal, environmental and other factors 9e48202a1c
