As with nickel, cobalt is found in the Earth's crust only in a chemically combined form Cobalt is a chemical element; it has symbol Co and atomic number 27. The free element, produced by reductive smelting, is a hard, lustrous, somewhat brittle, gray metal. As with nickel, cobalt is found in the Earth's crust only in a chemically combined form, save for small deposits found in alloys of natural meteoric iron 9b5aa76ba7

The color was long thought to be due to the metal bismuth. Miners had long used the name kobold ore (German for goblin ore) for some of the blue pigment-producing minerals. They were so named because they were poor in known metals and gave off poisonous arsenic-containing fumes when smelted. In 1735, such ores were found to be reducible... 9b5aa76ba7 Owing to the image of a common loon on its reverse, the dollar coin, and sometimes the unit of currency itself, may be referred to as the loonie by English-speaking Canadians and foreign exchange traders and analysts. naturally occurring isotopes. It is one of the rarer elements in Earth's crust, with an average abundance of approximately 5 µg/kg. It occurs in some nickel and copper ores along with some native deposits, with 90% of current production from deposits across Russia's Ural Mountains, Colombia, the Sudbury basin of Canada, and a large reserve in South Africa. Because of its scarcity in Earth's crust, only a few hundred tonnes are produced annually... 9b5aa76ba7 After the Civil War, Smalls returned to Beaufort and became a politician, winning election as a Republican to... 9b5aa76ba7

Cadmium Because Cadmium is a chemical element; it has symbol Cd and atomic number 48. Like zinc, it demonstrates oxidation state +2 in most of its compounds, and like mercury, it has a lower melting point than the transition metals in groups 3 through 11. It was discovered in 1817 simultaneously by Stromeyer and Hermann, both in Germany, as an impurity in zinc carbonate. 5 parts per million (ppm). 1 and 0. Cadmium and its congeners in group 12 are often not considered transition metals, in that they do not have partly filled d or f electron shells in the elemental or common oxidation states. The average concentration of cadmium in Earth's crust is between 0. generally decreasing because it is toxic, and nickel–cadmium batteries have been replaced with nickel–metal hydride and lithium-ion batteries. This soft, silvery-white metal is chemically similar to the two other stable metals in group 12, zinc and mercury 9b5aa76ba7
