Smear layer ISSN 0143-2885. Chapter 7. {{cite book}}: CS1 maint: multiple names: In dentistry, the smear layer is a layer found on root canal walls after root canal instrumentation. It consists of microcrystalline and organic particle debris. It was first described in 1975 and research has been performed since then to evaluate its importance in bacteria penetration into the dentinal tubules and its effects on endodontic treatment. Saunders, Saunders, WP, WE (1992). PMID 1291521. pp. More broadly, it is the organic layer found over all hard tooth surfaces. A Concise Guide to Endodontic Procedures c85fad5232

Hydrogen peroxide is analogous to carbamide peroxide as it is released when the stable complex is in contact with water. When it diffuses into the tooth, hydrogen peroxide acts as an oxidising agent that breaks down to produce unstable free radicals.
