Barotrauma 2006. decompression - Unplanned drop in the pressure of a sealed system US Navy Diving Manual, 6th revision. Barotrauma can occur during both compression and decompression. The initial damage is usually due to over-stretching the tissues in tension or shear, either directly by an expansion of the gas in the closed space or by pressure difference hydrostatically transmitted through the tissue. Tissue rupture may be complicated by the introduction of gas into the local tissue or circulation through the initial trauma site, which can cause blockage of circulation at distant sites or interfere with the normal function of an organ by its presence. The term is usually applied when the gas volume involved already exists prior to decompression. United States: US Naval Sea Systems Command. Archived Barotrauma is physical damage to body tissues caused by a difference in pressure between a gas space inside, or in contact with, the body and the surrounding gas or liquid 12e08e5cb3
