Crown (dental restoration) A crown is typically bonded to the tooth by dental cement. Some dentists will also finish root canal treatment by covering the exposed tooth with a crown. In dentistry, a crown or a dental cap is a type of dental restoration that completely caps or encircles a tooth or dental implant. A crown may be needed when a large dental cavity threatens the health of a tooth. They can be made from various materials, which are usually fabricated using indirect methods. A crown may be needed In dentistry, a crown or a dental cap is a type of dental restoration that completely caps or encircles a tooth or dental implant. While beneficial to dental health, the procedure and materials can be costly. Crowns are used to improve the strength or appearance of teeth and to halt deterioration 8df68e585b

Dental implant The basis for modern dental implants is a biological process called osseointegration, in which materials such as titanium or zirconia form an intimate bond to the bone. A variable amount of healing time is required for osseointegration before either the dental prosthetic (a tooth, bridge, or denture) is attached to the implant or an abutment is placed which will hold a dental prosthetic or crown. The implant fixture is first placed so that it is likely to osseointegrate, then a dental prosthetic is added. osseointegrated dental implants are healthy bone and gingiva. Since both can atrophy after tooth extraction, pre-prosthetic procedures such as sinus lifts A dental implant (also known as an endosseous implant or fixture) is a prosthesis that interfaces with the bone of the jaw or skull to support a dental prosthesis such as a crown, bridge, denture, or facial prosthesis or to act as an orthodontic anchor 8df68e585b

Abnormal alignment of the teeth and jaws is very common. The approximate worldwide prevalence of malocclusion was as high as 56%. However, conclusive scientific evidence for the health benefits of orthodontic treatment is lacking, although patients with completed treatment have reported a higher quality of life than that of untreated patients undergoing orthodontic treatment. The main reason for the prevalence of these malocclusions is diets with less fresh fruit and vegetables and overall softer...

8df68e585b As the root analogue dental implant matches the dental alveolus (tooth socket) it can only be placed immediately after the tooth extraction. If the tooth has been already lost and the soft and hard tissue is already healed, an RAI can no longer be placed. 8df68e585b

Root analogue dental implant In contrast to common titanium screw type implants, these implants are custom-made to exactly match the extraction socket of the specific patient. A root-analogue dental implant (RAI) – also known as a truly anatomic dental implant, or an anatomical/custom implant – is a medical device to replace A root-analogue dental implant (RAI) – also known as a truly anatomic dental implant, or an anatomical/custom implant – is a medical device to replace one or more roots of a single tooth immediately after extraction. Thus there is usually no need for surgery 8df68e585b
