Commonly known types of carbon are diamond and graphite. In 1947, Canadian physicist P. R. Wallace suggested carbon would also exist in sheets. German chemist Hanns-Peter Boehm and coworkers isolated single sheets from graphite, giving them the name graphene in 1986. In 2004, the material was characterized by Andre Geim and Konstantin Novoselov at the University of Manchester, England. They received the 2010 Nobel Prize in Physics for their experiments. 6cc02f3f31 He is a professor of the Graduate School in Physics at the University of California, Berkeley, and a Senior Scientist at the Lawrence Berkeley

National Laboratory. Zettl is a leading expert in the synthesis, characterization, and application of low dimensional materials. He has synthesized and studied new materials, notably those based on carbon, boron and nitrogen, and has made numerous inventions in the field of electronic materials and nano-electromechanical systems. Zettl and his research team were the first to synthesize boron nitride nanotubes, and created carbon nanotube chemical sensors. He and his team built the world's smallest synthetic electrically powered rotational nanomotor, the... 6cc02f3f31 The list contains 50,052 articles. -- Cewbot (talk) 14:18, 26 August 2025 (UTC) 6cc02f3f31

Graphene 1 tesla, about the same as the coils found in typical loudspeakers, according to Yakobson and his team – and about the same field strength as some MRI machines

Graphene () is a variety of the element carbon which occurs naturally in small amounts. The result resembles the face of a honeycomb. In graphene, the carbon forms a sheet of interlocked atoms as hexagons one carbon atom thick. When many hundreds of graphene layers build up, they are called graphite 6cc02f3f31
