Intel Core (microarchitecture) It also replaced the NetBurst microarchitecture, which suffered from high power consumption and heat intensity due to an inefficient pipeline designed for high clock

rate. It is a major evolution over the Yonah, the previous iteration of the P6 microarchitecture series which started in 1995 with Pentium Pro. In early 2004, Prescott needed very high power to reach the clocks it needed for competitive performance, making it unsuitable for the shift to dual/multi-core CPUs. ES/QS steppings are: B0 (CPUID 6F4h), B1 (6F5h) and E0 (6F9h). Steppings B2/B3, E1, and G0 of model 15 (cpuid 06fx) processors are evolutionary steps. The Intel Core microarchitecture (provisionally referred to as Next Generation Microarchitecture, and developed as Merom) is a multi-core processor microarchitecture launched by Intel in mid-2006. Character encoding Character encodings have also been defined for some constructed languages. Several simple schemes by using a byte order mark or escape sequences; compressing schemes try to minimize the number of bytes used per code unit (such as SCSU). Character encoding is a convention of using a numeric value to represent each character of a writing script. Not only can a character

set include natural language symbols, but it can also include codes that have meanings or functions outside of language, such as control characters and whitespace. The numerical values that make up a character encoding are known as code points and collectively comprise a code space or a code page. When encoded, character data can be stored, transmitted, and transformed by a computer
