Unicode font systems (Microsoft Windows, Apple Mac OS, and many versions of Unix and Linux), programming languages (Ada, Perl, Python, Java, Common LISP, APL), and Unicode font is a computer font that maps glyphs to code points defined in the Unicode Standard. By assuring unique assignments, Unicode resolved this issue. The distinction is historic: before Unicode, when most computer systems used only eight-bit bytes, no more than 256 characters (or control codes) could be encoded. This meant that each character repertoire had to have its own codepoint assignments – and thus a given codepoint could have multiple meanings. The term has become archaic because the vast majority of modern computer fonts use Unicode mappings, even those fonts which only include glyphs for a single writing system, or even only support the basic Latin alphabet 4119b71403
