Computer Modern digital electronic computers can perform generic sets of operations known as programs, which enable computers to perform a wide range of tasks. The term computer system may refer to a nominally complete computer that includes the hardware, operating system, software, and peripheral equipment needed and used for full operation; or to a group of computers that are linked and function together, such as a computer network or computer cluster. system is built, software is immaterial. Software includes computer programs, libraries and related non-executable data, such as online documentation A computer is a machine that can be programmed to automatically carry out sequences of arithmetic or logical operations (computation) d09b45d96b

The Pentium Pro was originally intended to replace the original Pentium in a full range of applications. Later, it was reduced to a more narrow role as a server and high-end desktop processor. The Pentium Pro was also used in

supercomputers, most notably ASCI Red, which was the first computer to reach over one teraFLOPS in 1996 and held the number one spot in the TOP500 list from 1997 to 2000. ASCI Red used two Pentium Pro CPUs on each computing node. d09b45d96b
