Modeling and simulation of batch distillation unit The vapor produced is richer in the more volatile components. There is no reflux. In practice, distillation may be carried out by either two principal methods. The first method is based on the production of vapor boiling the liquid mixture to be separated and condensing the vapors without allowing any liquid to return to the still. Distillation is the technique of preferential separation of the more volatile components from the less volatile ones in a feed followed by condensation. The distribution of the component in the two phase is governed by the vapour-liquid equilibrium relationship. The second method. Aspen Plus, Aspen HYSYS, ChemCad and MATLAB, PRO are the commonly used process simulators for modeling, simulation and optimization of a distillation process Aspen Plus, Aspen HYSYS, ChemCad and MATLAB, PRO are the commonly used process simulators for modeling, simulation and optimization of a distillation process in the chemical industries 34c7384bd7
