Lattice Boltzmann methods } Then, the second equation can be simplified with some algebra and the first equation into the following: $\partial f_i / \partial t = -\sum_j v_j \cdot \nabla f_{ij} + \sum_j \Omega_{ij}$ + The lattice Boltzmann methods (LBM), originated from the lattice gas automata (LGA) method (Hardy-Pomeau-Pazzis and Frisch-Hasslacher-Pomeau models), is a class of computational fluid dynamics (CFD) methods for fluid simulation. Also, fluids in complex environments such as porous media can be straightforwardly simulated, whereas with complex boundaries other CFD methods can be hard to work with. The method is versatile as the model fluid can straightforwardly be made to mimic common fluid behaviour like vapour/liquid coexistence, and so fluid systems such as liquid droplets can be simulated. Instead of solving the Navier–Stokes equations directly, a fluid density on a lattice is simulated with streaming and collision (relaxation) processes. $t_{1}^{2}}=-{\frac {f_{i}^{(2)}}{\tau }}$ b0d9bacf29

losses and gains of the other participant. In the 1950s, it was extended to the study of non zero-sum games, and was eventually applied to a wide range of behavioral relations
