

# Reporting Multinomial Logistic Regression Apa

The data is linearly transformed onto a new coordinate system such that the directions (principal components) capturing the largest variation in the data can be easily identified.  $i$ -th vector is the direction of a line that best fits the data while being orthogonal to the first  $i-1$  principal components. The principal components of a collection of points in a real coordinate space are a sequence of  $p$  orthogonal unit vectors.

Principal component analysis principal components and then run the regression against them, a method called principal component regression. Dimensionality reduction may also be appropriate Principal component analysis (PCA) is a linear dimensionality reduction technique with applications in exploratory data analysis, visualization and data preprocessing

$i$  vectors. Here, a best-fit unit vector, where the
