Equations of motion The functions are defined in a Euclidean space in classical mechanics, but are replaced by curved spaces in relativity. More specifically In physics, equations of motion are equations that describe the behavior of a physical system in terms of its motion as a function of time. The most general choice are generalized coordinates which can be any convenient variables characteristic of the physical system. If the dynamics of a system is known, the equations are the solutions for the differential equations describing the motion of the dynamics. More specifically, the equations of motion describe the behavior of a physical system as a set of mathematical functions in terms of dynamic variables. These variables are usually spatial coordinates and time, but may include momentum components. "The simplified form of Bernoulli's equation can be summarized in the following memorable word equation: Static pressure + Dynamic pressure = Total Bernoulli's principle is a key concept in fluid dynamics that relates pressure, speed and height. For example, for a fluid flowing horizontally Bernoulli's principle states that an increase in the speed occurs simultaneously with a decrease in pressure. Although Bernoulli deduced that pressure decreases when the flow speed increases, it was Leonhard Euler in 1752 who derived Bernoulli's equation in its usual form a85c5ab050
