Shallow focus Shallow focus is typically used to emphasize one part of the image over another. area(s) as bokeh. In shallow focus, one plane of the scene is in focus while the rest is out of focus. Photographers sometimes refer to the aesthetic quality of the unfocused area(s) as bokeh. Shallow focus has become more popular in the 2000s and Shallow focus is a photographic and cinematographic technique incorporating a small depth of field. The opposite of shallow focus is deep focus, in which the entire image is in focus

They argue that non-vital human interference with or destruction of the natural world poses a threat not only to humans, but to all organisms that make up the natural order.

The term comes from Vladimir Triandafilov, an influential military writer, who worked with others to create a military strategy with specialized operational art and tactics. The concept of deep operations was a state strategy, tailored to the economic, cultural and geopolitical position of the Soviet Union. In the aftermath of the failures in the Russo-Japanese War, the First World War, and the Polish-Soviet War the Soviet High...

Deep learning Methods used can be supervised, semi-supervised or unsupervised. The adjective "deep" refers to the use of multiple layers (ranging from three to several hundred or thousands) in the network. In machine learning, deep learning focuses on utilizing multilayered neural networks to perform tasks such as classification, regression, and representation. In machine learning, deep learning focuses on utilizing multilayered neural networks to perform tasks such as classification, regression, and representation learning. The field takes inspiration from biological neuroscience and is centered around stacking artificial neurons into layers and "training" them to process data.

Depth of focus (tectonics) In subduction zones, where older and colder oceanic crust sinks under another tectonic plate, deep-focus earthquakes may occur at much greater depths in the mantle, ranging from 300 km (190 mi) up to 700 km (430 mi). deep-focus earthquakes may occur at much greater depths in the mantle, ranging from 300 km (190 mi) up to 700 km (430 mi). Earthquakes occurring at a depth of less than 70 km (43 mi) are classified as shallow-focus earthquakes, while those with a focal depth between 70 km (43 mi) and 300 km (190 mi) are commonly termed mid-focus or intermediate-depth earthquakes. The cause of deep-focus earthquakes In seismology, the depth of focus or focal depth is the depth at which an earthquake occurs.

Deep focus is normally achieved by choosing a small aperture. Since the aperture of a camera determines how much light enters through the lens, achieving deep focus requires a bright scene or long exposure. A wide-angle lens also makes a larger portion of the image appear sharp.

Focus stacking Brenizer Method Deep focus Epsilon photography Focus bracketing Frazier lens High dynamic range imaging (HDR) Focus stacking – also called focal plane merging, z-stacking, focus bracketing or focus blending – is a digital image processing technique which combines multiple images taken at different focus distances to give a resulting image with a greater depth of field (DOF) than any of the individual source images. Focus stacking can also be useful in landscape photography. Focus stacking can be used in any situation where individual images have a very shallow depth of field; macro photography and optical microscopy are two typical examples. the sharpest areas in a stack of sections d580a08095

Focus stacking offers flexibility: since it is a computational technique, images with several different depths of field can be generated in post-processing and compared for best artistic merit or scientific clarity. Focus stacking also allows generation of images... d580a08095

Deep operation Deep operation (Russian: Глубокая операция, glubokaya operatsiya), also known as Soviet deep battle, was a military theory developed by the Soviet Union Deep operation (Russian: Глубокая операция, glubokaya operatsiya), also known as Soviet deep battle, was a military theory developed by the Soviet Union for its armed forces during the 1920s and 1930s. It was a tenet that emphasized destroying, suppressing or disorganizing enemy forces not only at the line of contact but also throughout the depth of the battlefield d580a08095

It is also possible to achieve the illusion of deep focus with optical tricks (split-focus diopter) or by compositing two or more images together using focus stacking. d580a08095
