Diving rebreather The purpose is to extend the breathing endurance of a limited gas supply, and, for covert military use by frogmen or observation of underwater life, to eliminate the bubbles produced by an open circuit system. Oxygen is added to replenish the amount metabolised by the diver. original on 2023-03-19. Sieber, Arne; Schuster, Andreas; Reif, Sebastian; Kessler, Michael; Lucyshyn, Thomas; Buzzacott, Peter; Enoksson A diving rebreather is an underwater breathing apparatus that absorbs the carbon dioxide of a diver's exhaled breath to permit the rebreathing (recycling) of the substantially unused oxygen content, and unused inert content when present, of each breath. Retrieved 2023-09-15. This differs from open-circuit breathing apparatus, where the exhaled gas is discharged directly into the environment 579d23724c
