List of topics characterized as pseudoscience The belief is that deceptive answers will produce physiological responses that This is a list of topics that have been characterized as pseudoscience by academics or researchers. Detailed discussion of these topics may be found on their main pages. These characterizations were made in the context of educating the public about questionable or potentially fraudulent or dangerous claims and practices, efforts to define the nature of science, or humorous parodies of poor scientific reasoning. conductivity while the subject is asked and answers a series of questions $\mathbb{H}$

Quaternion Quaternions were first described by the Irish mathematician William Rowan Hamilton in 1843 and applied to mechanics in three-dimensional space. Topics in physics and geometry that would now be described using vectors, such as kinematics in space In mathematics, the quaternion number system extends the complex numbers. quaternions were a mandatory examination topic in Dublin. The set of all quaternions is conventionally denoted by $\mathbb{H}$

In such a frame, an object with zero net force acting on it, is perceived to move with a constant velocity, or, equivalently, Newton’s first law of motion holds. Such frames are known as inertial. Some physicists, like Isaac Newton, originally thought that one of... $\mathbb{H}$ Young has been described as “The Last Man Who Knew Everything”. His work influenced that of William Herschel, Hermann von Helmholtz, James Clerk Maxwell, and Albert Einstein. Young is credited with establishing Christiaan Huygens’ wave theory of light, in contrast to the corpuscular theory of Isaac Newton. Young’s work was subsequently supported by the work of Augustin-Jean Fresnel. $\mathbb{H}$ Schwinn first declared bankruptcy in 1992 and was restructured. In 2001 Schwinn again declared bankruptcy and was purchased by Pacific Cycle, now owned by the Dutch conglomerate, Pon Holdings. $\mathbb{H}$

Thomas Young (scientist) relationship is a function of both geometry and material. He was instrumental in the decipherment of Egyptian hieroglyphs, specifically the Rosetta Stone. Young’s Modulus depends only on the material, not its geometry, thus allowing a revolution in engineering Thomas Young FRS (13 June 1773 – 10 May 1829) was a British polymath who made notable contributions to the fields of vision, light, solid mechanics, energy, physiology, language, musical harmony, and Egyptology $\mathbb{H}$

Mineralogy “Mineralogy”; Mineralogy is a subject of geology specializing in the scientific study of the chemistry, crystal structure, and physical (including optical) properties of minerals and mineralized artifacts. (2012). ; Brodersen, Kai; Champion, Craige B. London: CRC Press. Harrell, James A. And Practice. In Bagnall, Roger S. ISBN 9780203498705. Specific studies within mineralogy include the processes of mineral origin and formation, classification of minerals, their geographical distribution, as well as their utilization $\mathbb{H}$

H. Quaternions are not quite a field, because in general, multiplication of quaternions is not commutative. Quaternions provide a definition of the quotient of two vectors in a

three-dimensional space. Quaternions are generally represented in the form

Music theory The musicological approach to theory differs from music analysis "in that it takes as its starting-point not the individual work or performance but the fundamental materials from which it is built. ". 3:78–95. Oxford Music theory is the study of theoretical frameworks for understanding the practices and possibilities of music. The Oxford Companion to Music describes three interrelated uses of the term "music theory": The first is the "rudiments", that are needed to understand music notation (key signatures, time signatures, and rhythmic notation); the second is learning scholars' views on music from antiquity to the present; the third is a sub-topic of musicology that "seeks to define processes and general principles in music". Inertial frame of reference CRC Press. Holt and Company. The Principle of In classical physics and special relativity, an inertial frame of reference (also called an inertial space or a Galilean reference frame) is a frame of reference in which objects exhibit inertia: they remain at rest or in uniform motion relative to the frame until acted upon by external forces. p. Albert Einstein (1920). H. In such a frame, the laws of nature can be observed without the need to correct for acceleration. 17. Relativity: The Special and General Theory. p. ISBN 0-7503-0767-6. 4

Pi p. A Comprehensive Introduction to Differential Geometry. Kobayashi The number π (; spelled out as pi) is a mathematical constant, approximately equal to 3.14159, that is the ratio of a circle's circumference to its diameter. It appears in many formulae across mathematics and physics, and some of these formulae are commonly used for defining π , to avoid relying on the definition of the length of a curve. It is not the same as junk science. Pseudoscience is often characterized by contradictory, exaggerated or unfalsifiable claims; reliance on confirmation bias rather than rigorous attempts at refutation; lack of openness to evaluation by other experts; absence of systematic practices when developing hypotheses; and continued adherence long after the pseudoscientific hypotheses have been experimentally discredited. "pseudoscientific"; group asserts that its beliefs, practices, theories, etc

John von Neumann His analysis of the structure of self-replication preceded the discovery of the structure of DNA. Von Neumann had perhaps the widest coverage of any mathematician of his time, integrating pure and applied sciences and making major contributions to many fields, including mathematics, physics, economics, computing, and statistics. In his knowledge; von Neumann was unable to answer satisfactorily a question each in differential geometry, number theory, and algebra. He was a pioneer in building the mathematical framework of quantum physics, in the development of functional analysis, and in game theory, introducing or codifying concepts including cellular automata, the universal constructor and the digital computer. They concluded John von Neumann (von NOY-mən; Hungarian: Neumann János Lajos [ˈnojmøn ˈjaːnoʃ ˈlɒjoʃ]; December 28, 1903 – February 8, 1957) was a Hungarian and American mathematician, physicist, computer scientist and engineer

During... The demarcation between science and pseudoscience has scientific, philosophical, and political implications. Philosophers debate the nature of science and the general criteria for drawing the line between scientific theories and pseudoscientific... Criticism of pseudoscience, generally by the scientific community or skeptical organizations, involves critiques of the logical, methodological, or rhetorical bases of the topic in question. Though some of the listed topics continue to be investigated scientifically, others were only subject to scientific research in the past and today are considered refuted, but resurrected in a pseudoscientific...
