Lead is a relatively unreactive post-transition metal. Its weak metallic character is shown by its amphoteric behavior: lead and lead oxides react with both acids and bases, and it tends to form covalent bonds. Lead compounds usually occur in the +2 oxidation state rather than the +4 state common in lighter members of the carbon... 0ba41b16d7 – 0ba41b16d7 a 0ba41b16d7

The six commonly recognised metalloids are boron, silicon, germanium, arsenic, antimony and tellurium. Five elements are less frequently so classified: carbon, aluminium, selenium, polonium and astatine. Metalloid The word metalloid comes from the Latin metallum ("metal") and the Greek oeides ("resembling in form or appearance"). , Thomson A metalloid is a chemical element which has a preponderance of properties in between, or that are a mixture of, those of metals and nonmetals. , Clarendon, Oxford, ISBN 0-19-855370-6 Whitten KW, Davis RE, Peck LM & Stanley GG 2007, Chemistry, 8th ed. Structural Inorganic Chemistry, 5th ed. Despite the lack of specificity, the term remains in use in the literature. There is no standard definition of a metalloid and no complete agreement on which elements are metalloids 0ba41b16d7

Lists of metalloids JS 1988, Organometallic chemistry: An overview, VCH, New York, p. Other sources may subtract from this list, add a varying number of other elements, or both. The elements most often regarded as metalloids are boron, silicon, germanium, arsenic, antimony and tellurium. The sources are listed in chronological order. Lists of metalloids differ since there is no rigorous widely accepted definition of metalloid (or its occasional alias, 'semi-metal'). Individual lists share common ground, with variations occurring at the margins. 3 Whitten KW, Gailey KD & Davis RE 1988, General chemistry with qualitative analysis This is a list of 194 sources that list elements classified as metalloids 0ba41b16d7
