Flying probe Flying probes were introduced in the late 1980s and can be found in many manufacturing and assembly operations, most often in manufacturing of electronic printed circuit boards. Flying probe testers are a more flexible alternative to bed of nails testers, which use multiple contacts to simultaneously contact the board and which rely on electrical switching to carry out measurements. A flying probe tester uses one or more test probes to make contact with the circuit board under test; the probes are moved from place to place on the circuit board to carry out tests of multiple conductors or components. more costly. In the testing of printed circuit boards, a flying probe test or fixtureless in-circuit test (FICT) system may be used for testing low to mid Flying probes are test probes used for testing both bare circuit boards and boards loaded with components 950c2cc0d8

In-circuit testing It has maintained its popularity over the years due to its ability to diagnose component-level faults and its operational speed. In-circuit testing (ICT) is an example of white box testing where an electrical probe tests a populated printed circuit board (PCB), checking for shorts In-circuit testing (ICT) is an example of white box testing where an electrical probe tests a populated printed circuit board (PCB), checking for shorts, opens, resistance, capacitance, and other basic quantities which will show whether the assembly was correctly fabricated. It may be performed with a "bed of nails" test fixture and specialist test equipment, or with a fixtureless in-circuit test setup. In-Circuit Test (ICT) is a widely used and cost-efficient method for testing medium- to high-volume electronic printed circuit board assemblies (PCBAs) 950c2cc0d8
