Photoconductive polymer Photoconductive
polymer is a smart material based on

conductive polymer, and the electrical conductivity can be controlled by the amount of radiation. Conductive polymers usually have large electrical conductivity. Electrical conductivity is usually very small in organic compounds. Photoconductive polymers have been used in a wide variety of technical applications such as Xerography (electrophotography) and laser printing. Photoconductive polymers absorb electromagnetic radiation and produce an increase of electrical conductivity.

Sun mass ejections, then called "coronal transients", and of coronal holes, now known to be intimately associated with the solar wind. The Sun has been an object of veneration in many cultures and a central subject for astronomical research since antiquity. It is by far the most important source of energy for life on Earth. It is a massive, nearly perfect sphere of hot plasma, heated to incandescence by nuclear fusion reactions in its core, radiating the energy from its surface mainly as visible light and infrared radiation with 10% at ultraviolet energies. In

1980, the Solar Maximum The Sun is the star
at the centre of the Solar System 76cd129668

In 1964 in his Ph.D. thesis (Technical
University of Munich), Dr. Hermann Dommel
used Nodal analysis with the companion
circuit model and the constant-parameter
transmission line model, to simulate
electromagnetic transients. The companion
circuit model used the trapezoidal integration
rule. At that time Bonneville Power
Administration also started to develop a
computer software for studying switching
overvoltages for insulation coordination. In
1966, Hermann Dommel was invited to BPA
from Germany to work on the development of
a software... 76cd129668 idea lab

Transient modelling ISBN 978-0471620587

Transient modelling (also called time-dependent modelling or unsteady simulation) is the practice of analysing physical, biological or socio-economic processes whose state variables vary continuously with time. Wiley. Unlike steady state (equilibrium) analysis—where only the initial and final conditions are considered—transient modelling follows the complete evolution of a system from one state to another, capturing the rates, lags and feedbacks that occur along the way.).
