Giardia duodenalis The parasite exists in two forms; trophozoites and cysts. *duodenalis* is a

non-invasive parasite, that does not spread to other parts of the gastrointestinal tract, but remains confined to the lumen of the small intestine. 55 (1): 43–47. doi:10 Giardia duodenalis, also known as Giardia intestinalis and Giardia lamblia, is a flagellated parasitic protozoan microorganism of the genus Giardia that colonizes the small intestine, causing a diarrheal condition known as giardiasis. The microorganism can undergo encystation, transforming into a dormant cyst that enables it to survive outside of its host. The parasite attaches to the intestinal epithelium by a ventral disc (syn. Journal of Clinical Microbiology. adhesive disc or sucker), and reproduces via binary fission. "Medical Parasitology Taxonomy Update: January 2012 to December 2015". Kraft CS (January 2017). G. Giardia trophozoites are anaerobic, and absorb their nutrients from the intestinal

Malaria 4. Clinical Microbiology Reviews. Symptoms usually begin 10 to 15 days after being bitten by an infected Anopheles mosquito. 15. If not properly treated, people may have recurrences of the disease months later. In those who have recently survived an infection, reinfection usually causes milder symptoms. Cox FE (October 2002). 595-612 Malaria is a mosquito-borne infectious disease that affects vertebrates and Anopheles mosquitoes. The mosquitoes themselves are harmed by malaria, causing reduced lifespans in those infected by it. PMC 3044689. In severe cases, it can cause jaundice, seizures, coma, or death. This partial resistance disappears over months to years if the person has no continuing exposure to malaria. Human malaria causes symptoms that typically include fever, fatigue, vomiting, and headaches. 1128/CMR. PMID 21383971. "History of human parasitology". doi:10.15 (4): 595–612
