List of datasets for machine-learning research Proceedings of the IEEE Conference on Computer Vision and Pattern Recognition Workshops. Nilsback, Maria-Elena, and Andrew Zisserman. Datasets are an integral part of the field of machine learning. High-quality labeled training datasets for supervised and semi-supervised machine learning algorithms are usually difficult and expensive to produce because of the large amount of time needed to label the data. Although they do not need to be labeled, high-quality datasets for unsupervised learning can also be difficult and costly to produce. Major advances in this field can result from advances in learning algorithms (such as deep learning), computer hardware, and, less-intuitively, the availability of high-quality training datasets. 2014. John von Neumann Princeton: Princeton John von Neumann (von NOY-mən; Hungarian: Neumann János Lajos [ˈnɔjmɒn ˈjaːnof ˈlɔjoʃ]; December 28, 1903 – February 8, 1957) was a Hungarian and American mathematician, physicist, computer scientist and engineer. His analysis of the structure of self-replication preceded the discovery of the structure of DNA. He was a pioneer in building the mathematical framework of quantum physics, in the development of functional analysis, and in game theory, introducing or codifying concepts including cellular automata, the universal constructor and the digital computer. 2024-11-06. Von Neumann had perhaps the widest coverage of any mathematician of his time, integrating pure and applied sciences and making major contributions to many fields, including mathematics, physics, economics, computing, and statistics. Woody plant encroachment Data collection can typically involve mapping and morphological characterisation of trees and shrubs Woody plant encroachment (also called woody encroachment, bush encroachment, shrub encroachment, shrubification, woody plant proliferation, or bush thickening) is a natural phenomenon characterised by the area expansion and density increase of woody plants, bushes and shrubs, at the expense of the herbaceous layer, grasses and forbs. Woody encroachment is observed across different ecosystems and

with different characteristics and intensities globally. quantification and mapping methods have been developed. It refers to the expansion of native plants and not the spread of alien invasive species. It predominantly occurs in grasslands, savannas and woodlands and can cause regime shifts from open grasslands and savannas to closed woodlands 69188290c7
