

Padi Rescue Diver Exam Answer

Version B

Most dive computers use real-time ambient pressure input to a decompression algorithm to indicate the remaining time to the no-stop limit, and after...

Dive computer Dive computers are a development from decompression tables, the diver's watch and depth gauge, with greater accuracy and the ability to monitor dive profile data in real time. A secondary function is to record the dive profile, warn the diver when certain events occur, and provide useful information about the environment. Similarly, PADI schools offer a course called "Computer Diving Specialist", which has a prerequisite certification of PADI Open Water Diver, the minimum A dive computer, personal decompression computer or decompression meter is a device used by an underwater diver to measure the elapsed time and depth during a dive and use this data to calculate and display an ascent profile which, according to the programmed decompression algorithm, will give a low risk of decompression sickness 1117a0dfaf

Diver training professional diver with entry level qualification is expected to perform duties as working diver, diver's attendant, and standby (rescue) diver, and must Diver training is the set of processes through which a person learns the necessary and desirable skills to safely dive underwater within the scope of the diver training standard relevant to the specific training programme. Most diver training follows procedures and schedules laid down in the associated training standard, in a formal training programme, and includes relevant foundational knowledge of the underlying theory, including some basic physics, physiology and environmental information, practical skills training in the selection and safe use of the associated equipment in the specified underwater environment, and assessment of the required skills and knowledge deemed necessary by the certification agency to allow the newly certified diver to dive within the specified range of conditions 1117a0dfaf
