Microsoft Data Access Components access almost any data store. There have been several deprecated components as well, such as the Jet Database Engine, MSDASQL (the OLE DB provider for ODBC), and Remote Data Services (RDS). Some components have also become obsolete, such as the former Data Access Objects API and Remote Data Objects. Its components include: ActiveX Data Objects (ADO), OLE DB, and Open Database Connectivity (ODBC). Its components include: ActiveX Data Objects (ADO), OLE DB, and Open Database Connectivity (ODBC). There have been several Microsoft Data Access Components (MDAC; also known as Windows DAC) is a framework of interrelated Microsoft technologies that allows programmers a uniform and comprehensive way of developing applications that can access almost any data store d8c4a132c8

Sync Framework can be used for offline access to data, by working against a cached set of data and submitting the changes to a master database in a batch, as well as to synchronize changes to a data source across all consumers (publish/subscribe sync) and peer-to-peer synchronization of multiple data sources. Sync Framework features built-in capabilities for conflict detection – whether data to be changed has already been updated – and can flag them for manual inspection or use d8c4a132c8

Borg-Warner 35 transmission in 1965. When model number specific it will use the exact model number. This article also applies to variations—the M-36 and M-37. It has a higher torque. The Borg-Warner 35 transmission (BW-35) is an automatic transmission produced by the BorgWarner company. It was used behind the 232 in larger vehicles. The M-37 is first mentioned in the 1967 AMC Technical Service Manual (TSM). When this article refers to "M-3x" it refers to

List of diagnostic classification and rating scales used in psychiatry For instance, in the category of depression, there are over two dozen depression rating scales that have been developed in the past eighty years. Autism Diagnostic Observation Schedule Research-determined cut-offs identify the potential diagnosis of autism spectrum disorder, allowing a standardized

assessment of autistic symptoms. The protocol consists of a series of structured and semi-structured tasks that involve social interaction between the examiner and the person under assessment. The examiner observes and identifies aspects of the subject's behavior, assigns these to predetermined categories, and combines these categorized observations to produce quantitative scores for analysis. The ADI-R has lower sensitivity but similar specificity to the ADOS. The ADI-R and ADOS are both considered gold standard diagnostic tests for autism. The Autism Diagnostic Observation Schedule (ADOS) is a standardized diagnostic test for assessing autism spectrum disorder (ASD)

The "3" in the number refers to the specific series of transmission. The M-3x, 4x, 5x and 6x transmissions are all aluminum cased transmissions that are related to the M-35 (the first of the aluminum Borg-Warner automatics). In this case the rising series number is relative to transmission strength—a larger number will withstand more power than a smaller number. This isn't, however, a general rule with Borg-Warner automatics. The earlier M-8 and M-1x cast iron case transmissions are much stronger than the aluminum...
