Sodium hydroxide is a highly corrosive base and alkali that decomposes lipids and proteins at ambient temperatures, and may cause severe chemical burns at high concentrations. It is highly soluble in water, and readily absorbs moisture and carbon dioxide from the air. It forms a series of hydrates $\text{NaOH} \cdot n\text{H}_2\text{O}$. The monohydrate $\text{NaOH} \cdot \text{H}_2\text{O}$ crystallizes from water solutions between 12.3 and 61.8 °C. The commercially available "sodium hydroxide" is often this monohydrate, and published data may refer to it instead of the anhydrous compound. The page you are currently viewing is an archive page. Comet His system for classifying comets according to their color and shape was used for centuries. A comet is an icy, small Solar System body that warms and begins to release gases

when passing close to the Sun, a process called outgassing. These phenomena are due to the effects of solar radiation and the outstreaming solar wind plasma acting upon the nucleus of the comet. Comet nuclei range from a few hundred meters to tens of kilometers across and are composed of loose collections of ice, dust, and small rocky particles. If sufficiently close and bright, a comet may be seen from Earth without the aid of a telescope and can, describing their tails with "long hair" or "long beard". This produces an extended, gravitationally unbound atmosphere or coma surrounding the nucleus, and sometimes a tail of gas and dust gas blown out from the coma. The coma may be up to 15 times Earth's diameter, while the tail may stretch beyond one astronomical unit

The most prominent feature of the 3DS is its ability to display stereoscopic 3D images without the use of 3D glasses or additional accessories. Other features of the 3DS include its StreetPass and SpotPass tag modes that were powered by Nintendo Network, augmented reality capabilities using its 3D camera system, and Virtual Console, which provides...
