Components are often designed to generate as little heat as possible, and computers and operating systems may be designed to reduce power consumption and consequent heating according to workload, but more heat may still be produced than can be removed without attention to cooling. Use of heatsinks cooled by airflow reduces the temperature rise produced by a given amount of heat. Attention to patterns of airflow... 12f78f0b74

Computer cooling In this technique, a coolant is flowed through a small orifice to form a jet. impingement cooling. Components that are susceptible to temporary malfunction or permanent failure if overheated include integrated circuits such as central processing units (CPUs), chipsets, graphics cards, hard disk drives, and solid state drives (SSDs). The jet is directed toward the surface of the CPU chip, Computer cooling is required to remove the waste heat produced by computer components, to keep components within permissible operating temperature limits 12f78f0b74
