Ancestral reconstruction BADGER uses a Bayesian approach to examining the history of gene rearrangement. Count Ancestral reconstruction (also known as Character Mapping or Character Optimization) is the extrapolation back in time from measured characteristics of individuals, populations, or species to their common ancestors. In the context of evolutionary biology, ancestral reconstruction can be used to recover different kinds of ancestral character states of organisms that lived millions of years ago. g. It is an important application of phylogenetics, the reconstruction and study of the evolutionary relationships among individuals, populations or species to their ancestors. related genomes through ancestral reconstruction of genetic markers. , gene order), a measurable characteristic of an organism (phenotype), and the geographic. These states include the genetic sequence (ancestral sequence reconstruction), the amino acid sequence of a protein, the composition of a genome (e
