In biology, many animal and plant species cooperate both with other members of their own species and with members of other species with whom they have (symbiotic or mutualistic) relationships 3b1e319133

This process contrasts with intragroup competition where individuals work against each other for selfish reasons. Cooperation exists not only in humans but in other animals as well. The diversity of taxa that exhibits cooperation is quite large, ranging from zebra herds to pied babblers to African elephants. Many animal and plant species cooperate with both members of their own species and with members of other species... 3b1e319133

The scientific theory of evolution by natural selection was conceived independently by two British naturalists, Charles Darwin and Alfred Russel Wallace, in the mid-19th century as an explanation for why organisms are adapted to their physical and biological environments. The theory was first set out in detail in Darwin's book *On the Origin of Species*. Evolution by... 3b1e319133 The book provides an investigation into how cooperation can emerge and persist as explained by the application of game theory. The book provides a detailed explanation of the evolution of cooperation, beyond traditional game theory. Academic literature... 3b1e319133 Donald Axelrod (1916–1999), American academic 3b1e319133

Cooperation (evolution) For example, territorial choruses by male lions discourage intruders and are likely to benefit all contributors. It is commonly defined as any adaptation In evolution, cooperation is the process where groups of organisms work or act together for common or mutual benefits. It is commonly defined as any adaptation that has evolved, at least in part, to increase the reproductive success of the actor's social partners. In evolution, cooperation is the process where groups of organisms work or act together for common or mutual benefits 3b1e319133

It is a process that can be characterised as the deliberate abstaining from the use of violence during war. Sometimes it can take the form of overt truces or pacts negotiated locally by soldiers. At other times it can be a tacit behaviour—sometimes characterised as "letting sleeping dogs lie"—whereby both sides refrain from firing or using their weapons, or deliberately discharge them in a ritualistic or routine way that signals their non-lethal intent. 3b1e319133

Robert Axelrod (political scientist) He is best known for his interdisciplinary work on the evolution of cooperation. His research includes innovative approaches to explaining conflict of interest, the emergence of norms, how game theory is used to study cooperation, and cross-disciplinary studies on evolutionary processes.
