Oil refinery There is usually an oil depot at or near an oil refinery for the storage of incoming crude oil feedstock as well as bulk liquid products. 2 million barrels per day. Alternative processes for removing mercaptans An oil refinery or petroleum refinery is an industrial process plant where petroleum (crude oil) is transformed and refined into products such as gasoline (petrol), diesel fuel, asphalt base, fuel oils, heating oil, kerosene, liquefied petroleum gas and petroleum naphtha. Merox desulfurize LPG, kerosene or jet fuel by oxidizing mercaptans to organic disulfides. In 2020, the total capacity of global refineries for crude oil was about 101. The crude oil feedstock has typically been processed by an oil production plant. Petrochemical feedstock like ethylene and propylene can also be produced directly by cracking crude oil without the need of using refined products of crude oil such as naphtha. viscosity products 2f0117a8f3
