The first XT 500 was shown at the US dealer convention in September 1975, and in Europe in the summer of 1976. The bike became an instant success and was produced until 1981 when it was replaced by four-valve engines. It laid the ground for the later range of XT bikes ranging from 125 cc (XT125) to the current 660 cc (Yamaha XT660Z Ténéré) and contributed largely to Yamaha's image. In France alone, 62,000 XT 500s were sold from 1976 to 1990.

Historically, some 2,000 units of the Megola were produced between 1921 and 1925 with front wheel drive, and the modern Rokon, an all terrain motorcycle with both wheels driven, has been produced since 1960. 97ed1b762b

Motorcycle braking systems Most systems work by converting kinetic energy into thermal energy (heat) by friction. This however can vary for individual motorcycles; longer-wheelbase types having more weight biased rearward, such as cruisers and tourers, can have a greater effort applied by the rear brake. In contrast, sports bikes with a shorter wheelbase and more vertical fork geometry can tolerate higher front braking loads. For these reasons, motorcycles tend to have a vastly more powerful front brake compared to the rear. On motorcycles, approximately 70% of the braking effort is performed by the front brake. front and rear on their 1923 RA model, sometimes called TT model, with Freddie Dixon's 1923 sidecar TT-winning machine of that type also having a passenger-operated Motorcycle braking systems have varied throughout time, as motorcycles evolved from bicycles with an engine attached, to the 220 mph (350 km/h) prototype motorcycles seen racing in MotoGP 97ed1b762b
