Morphine Biochemical and Biophysical Research Morphine, formerly known as morphium, is an opiate found naturally in opium, a dark brown resin produced by drying the latex of opium poppies (*Papaver somniferum*). "Endogenous nitric oxide modulates morphine-induced constipation". It is mainly used as an analgesic (pain medication). Physical and psychological dependence and tolerance may develop with repeated

administration. There are multiple methods used to administer morphine: oral; sublingual; via inhalation; injection into a muscle, injection under the skin, or injection into the spinal cord area; transdermal; or via rectal suppository. It can be taken for both acute pain and chronic pain and is frequently used for pain from myocardial infarction, kidney stones, and during labor. Calignano A, Moncada S, Di Rosa M (December 1991). It acts directly on the central nervous system (CNS) to induce analgesia and alter perception and emotional response to pain 935e0e1fae
