Turret lathe It evolved from earlier lathes with the addition of the turret, which is an indexable toolholder that allows multiple cutting operations to be performed, each with a different cutting tool, in easy, rapid succession, with no need for the operator to perform set-up tasks in between (such as installing or uninstalling tools) or to control the toolpath. A turret lathe is a form of metalworking lathe that is used for repetitive production of duplicate parts, which by the nature of their cutting process A turret lathe is a form of metalworking lathe that is used for repetitive production of duplicate parts, which by the nature of their cutting process are usually interchangeable. The latter is due to the toolpath's being controlled by the machine, either in jig-like fashion, via the mechanical limits placed on it by the turret's slide and stops, or via digitally-directed servomechanisms

for computer numerical control lathes a511014556

Automatic lathe Automatic lathes were first developed in the 1870s In metalworking and woodworking, an automatic lathe is a lathe with an automatically controlled cutting process. From the advent of NC and CNC in the 1950s, the term automatic lathe has generally been used for only mechanically controlled lathes, although some manufacturers (e. , DMG Mori and Tsugami) market Swiss-type CNC lathes as 'automatic'. metalworking and woodworking, an automatic lathe is a lathe with an automatically controlled cutting process. g. Automatic lathes were first developed in the 1870s and were mechanically controlled a511014556

CNC has not yet entirely displaced mechanically automated lathes, as although no longer in production, many mechanically automated lathes remain in service. a511014556
