Behaviorism It also laid the theoretical foundation for the early approach behavior modification in the 1970s and 1980s. The cognitive revolution of the late 20th century largely replaced behaviorism as an explanatory theory with cognitive psychology, which unlike behaviorism views internal mental states. Although behaviorists generally accept the important role of heredity in determining behavior, deriving from Skinner's two levels of selection (phylogeny and ontogeny), they focus primarily on environmental events. It assumes that behavior is either a reflex elicited by the pairing of certain antecedent stimuli in the environment, or a consequence of that individual's history, including especially reinforcement and punishment contingencies, together with the individual's current motivational state and controlling stimuli. considered part of the science of behavior. Organizational behavior management Organizational behavior management (OBM) is a subdiscipline of applied behavior analysis (ABA), which is the application of behavior analytic principles and contingency Organizational behavior management (OBM) is a subdiscipline of applied behavior analysis (ABA), which is the application of behavior analytic principles and contingency management techniques to change behavior in organizational settings. Through these principles and assessment of behavior, OBM seeks to analyze and employ antecedent, influencing actions of an individual before the action occurs, and consequence, what happens as a result of someone's actions, interventions which influence behaviors linked to the mission and key objectives of the organization and its workers. Such interventions have proven effective through research in improving common organizational areas including employee productivity, delivery of feedback, safety, and overall morale of said organization 1f12642fe8

Cognitive behavioral therapy This therapy focuses on challenging unhelpful and irrational negative thoughts and beliefs, referred to as 'self-talk' and replacing them with more rational positive self-talk. It was developed by psychoanalyst Aaron Beck in the 1950's. common

For example, a rat can be trained to push a lever to receive food whenever a light is turned on; in this example, the light is the antecedent stimulus, the lever pushing is the operant behavior, and the food is the reinforcer. About Behaviorism Miltenberger, R. F. Tucker M, Sigafos In behavioral psychology, reinforcement refers to consequences that increase the likelihood of an organism's future behavior, typically in the presence of a particular antecedent stimulus. Likewise, a student that receives attention and praise when answering a teacher's question will be more likely to answer future questions in class; the teacher's question is the antecedent, the student's response is the behavior, and the praise and attention are the reinforcements

Behaviour therapy that accord with this broad conception of behavior therapy. Behaviourists who practice these techniques are either behaviour analysts or cognitive-behavioural therapists. It looks at specific, learned behaviours and how the environment, or other people's mental states, influences those behaviours, and consists of techniques based on behaviorism's theory of learning: respondent or operant conditioning. They tend to look for treatment outcomes that are objectively measurable. The first use of the term behaviour modification appears to have been by Edward Thorndike in Behaviour therapy or behavioural psychotherapy is a broad term referring to clinical psychotherapy that uses techniques derived from behaviourism and/or cognitive psychology. Behaviour therapy does not involve one specific method, but it has a wide range of techniques that can be used to treat a person's psychological problems 1f12642fe8

The term applied behavior analysis has replaced behavior modification because the latter approach suggested changing behavior without clarifying the relevant behavior-environment interactions. In contrast, ABA changes behavior by first assessing the functional relationship between a targeted behavior and the environment, a process known as a functional behavior assessment.
