in which the interval between probes increases linearly (hence, the indices are described by a quadratic function).

Hash table Data Structures Using C. (1990). A hash table uses a hash function to compute an index, also called a hash code, into an array of buckets or slots, from which the desired value can be found. 472. Retrieved June 13, 2010. Tenenbaum, Aaron M. pp. ; Langsam, Yedidiah; Augenstein, Moshe J. During lookup, the key is hashed and the resulting hash indicates where the corresponding value is stored. 456–461, p. In computer science, a hash table is a data structure that implements an associative array, also called a dictionary or simply map; an associative array is an abstract data type that maps keys to values. Prentice Hall. A map implemented by a hash table is called a hash map 507efc3132

Open addressing Well-known probe sequences include:. (1990), Data Structures Using C, Prentice Hall, pp Open addressing, or closed hashing, is a method of collision resolution in hash tables. With this method a hash collision is resolved by probing, or searching through alternative locations in the array (the probe sequence) until either the target record is found, or an unused array slot is found, which indicates that there is no such key in the table.
